

The Role of Membrane Carbohydrates in Cell-Cell Recognition

- Cell-cell recognition is a cell's ability to **distinguish** one type of **neighboring cells** from another.
- Cells **recognize** other cells by **binding** to **molecules**, often containing carbohydrates, on the extracellular surface of the plasma membrane.
- Membrane carbohydrate usually plays an important role in cell-cell recognition. They are **usually short**, branched chains of fewer than **15 sugar units**.
- Some are **covalently bonded** to **lipids**, forming molecules called **glycolipids**. Most are covalently bonded to **proteins**, which are thereby **glycoproteins**.
- The carbohydrates on the **extracellular side** of the plasma membrane vary from **species to species**, among individuals of the **same species**, and even from **one cell type to another** in a single individual.
- They are used to identify a **type of cell**, if exploited by virus, then virus **gains the entry**.

ImmunoPhysics and ImmunoEngineering Jorge Bernardino De La Serna, Mario Mellado, Maria Garcia-Parajo, Michael Loran Dustin, Dimitrios Morikis, 2020-03-30 ImmunoPhysics ImmPhys and ImmunoEngineering ImmPhysEng are two cross disciplinary fields ImmPhysEng aims to unravel quantitatively the immune system function and regulation in health and disease Whereas ImmPhys study and assess the physical basis of the immune response ImmEng pursues its control and prediction Ultimately the overarching goal of these disciplines is to facilitate the development of therapeutic interventions to more precisely modulate and control the compromised immune response during diseases Lately these disciplines are becoming more popular and as such the number of publications applying physical or engineering tools to understand the immune response is increasing Nevertheless there is still no scientific forum compiling the ImmPhysEng research breakthroughs Possibly the biggest burden is to stimulate a fluent communication and syntony between a physicist or engineer and an immunologist

Molecular Basis of NK Cell Recognition and Function L. Moretta, 1996 Natural killer NK cells have been the subject of intense investigation Only in recent years however could the molecular mechanisms by which they lyse tumor or virus infected cells but spare normal cells be elucidated NK cells express different specialized receptors NK R specific for major histocompatibility complex MHC class I molecules These MHC molecules exert an inhibitory effect on NK cells i e lack of expression of one or more MHC class I alleles a common event in tumor or virus infected cells leads to NK mediated target cell lysis Recently NK type receptors have also been identified in a subset of T lymphocytes MHC NK R interaction causes inhibition of T cell activation and functions an observation which suggests a role for these receptors in the negative control of T cell responses This volume offers a complete and updated review of the signal transduction and functions of NK cells as well as their roles in transplantation anti tumor response and infectious diseases Written by experienced investigators who have contributed significantly to progress in the field this collection of reviews will be a valuable resource for basic and clinical immunologists hematologists oncologists and virologists

Self and Nonself Carlos López-Larrea, 2012-03-07 In 1960 Sir Frank Macfarlane Burnet received the Noble Prize in Physiology and Medicine He titled his Nobel Lecture Immunological Recognition of Self emphasizing the central argument of immunological tolerance in How does the vertebrate organism recognize self from nonself in this the

immunological sense and how did the capacity evolve The concept of self is linked to the concept of biological self identity All organisms from bacteria to higher animals possess recognition systems to defend themselves from nonself Even in the context of the limited number of metazoan phyla that have been studied in detail we can now describe many of the alternative mechanism of immune recognition that have emerged at varying points in phylogeny Two different arms the innate and adaptive immune system have emerged at different moments in evolution and they are conceptually different The ultimate goals of immune biology include reconstructing the molecular networks underlying immune processes Cellular Recognition Melvyn F. Greaves,1975 Outline studies in biology **Cellular Recognition Systems in Plants** John Heslop-Harrison,1978 Cell Interactions in Differentiation Marketta Karkinen-Jaaskelainen,2012-12-02 Cell Interactions in Differentiation is a collection of papers presented at the Sixth Sigrid Jus lius Foundation Symposium held in Helsinki Finland in August 1976 Contributors discuss cell interactions during differentiation particularly referring to the problem of embryonic induction They also consider how a cell becomes adjusted to the synchronized development of an entire multicellular organism so as to express its genetic information at a strictly controlled time and place This volume is organized into five sections encompassing 30 chapters and begins with an overview of embryonic cells and their two fundamental properties Cells are not necessarily predetermined and can be experimentally diverted from their normal developmental pathway and those within an embryonic organism require extrinsic messages to express their developmental capacities The next chapters focus on early determinative events in embryogenesis touching on topics such as the genetic aspects of cell type determination interactions between embryonic cells during the early development of the mouse and the differentiation of teratocarcinoma stem cells in vitro The reader is then introduced to positional information and morphogenetic signals the biological specificity of morphogenetic tissue interactions and the molecular mechanisms underlying cell contact interactions The remaining chapters explore some of the most important conceptual and methodological approaches to the problems of cell cell recognition and the integration of cells into multicellular systems This book will be of interest to scientists and investigators in developmental biology and related fields **Receptors of Cell Adhesion and Cellular Recognition** A.G. Lee,1996-06-25 Volume 3 of Biomembranes covers receptors of cell adhesion and cellular recognition Proteins in the plasma membrane of cells are heavily involved in processes of cell adhesion but such proteins were not actually isolated and characterized until the mid 1970s Since then application of the methods of molecular biology has led to the recognition of four major classes of cell adhesion molecule CAMs the immunoglobulin super family the cadherins the integrins and the selecting A convenient system in which to study the importance of cell adhesion is in blood platelets where aggregation eventually leads to thrombus formation in a process involving a range of surface glycoproteins Interaction with the extracellular matrix is exemplified by CD44 the receptor for hyaluronan and a complex carbohydrate that is a major component of the extracellular matrix surrounding migrating and proliferating cells Membrane associated mucins have a

variety of effects on cell adhesion The super family of immunoglobulin related proteins also include the T cell receptors and the major histocompatibility complex MHC which together with the receptors for immunoglobulins the Fc receptors are of fundamental importance in the processes of immunity Volume 3 of Biomembranes explores the structures and functions of the molecules involved in these important functions of the cell

Drug Toxicity in Embryonic Development I

Robert J. Kavlock,George P. Daston,2012-12-06 Having received the invitation from Springer Verlag to produce a volume on drug induced birth defects for the Handbook of Experimental Pharmacology we asked ourselves what new approach could we offer that would capture the state of the science and bring a new synthesis of the information on this topic to the world s literature We chose a three pronged approach centered around those particular drugs for which we have a relatively well established basis for understanding how they exert their unwanted effects on the human embryo We then supplemented this information with a series of reviews of critical biological processes involved in the established normal developmental patterns with emphasis on what happens to the embryo when the processes are perturbed by experimental means Knowing that the search for mechanisms in teratology has often been inhibited by the lack of understanding of how normal development proceeds we also included chapters describing the amazing new discoveries related to the molecular control of normal morphogenesis for several organ systems in the hope that the experimental toxicologists and molecular biologists will begin to better appreciate each others questions and progress Several times during the last two years of developing outlines issuing invitations reviewing chapters and cajoling belated contributors we have wondered whether we made the correct decision to undertake this effort

The Cellular Basis of Morphogenesis

Leon W. Browder,1986-05-31 This series was established to create comprehensive treatises on specialized topics in developmental biology Such volumes are especially vital in develop mental biology since it is a very diverse field that receives contributions from a wide variety of disciplines This series is a meeting ground for the various practitioners of this science facilitating an integration of heterogeneous information on specific topics Each volume is intended to provide the conceptual basis for a comprehensive understanding of its topic as well as an analysis of the key experiments upon which that understanding is based The specialist in any aspect of devel opmental biology should understand the experimental background of the field and be able to place that body of information in context to ascertain where additional research would be fruitful At that point the creative process takes over and new experiments are designed This series is intended to be a vital link in that ongoing process of learning and discovery If it facilitates schol arship it will serve an important function

The

Molecular Basis of Sex and Differentiation Milton H. Saier, Gary R. Jacobson, 1984-10-10 Man's mind stretched to a new idea never goes back to its original dimensions Oliver Wendell Holmes Our current understanding of sex and biological differentiation results from the application of three principal experimental approaches to these subjects those of the physiologist the biochemist and the geneticist These three approaches are illustrated by the materials presented in the chapters of this volume Chapters 1-5 emphasize conceptualization of developmental processes describing systems principally from the standpoint of the physiologist Structures and functions are defined with only occasional reference to specific molecular details Chapters 6-10 present the views of the biochemist attempting to describe functions influencing or regulating cellular behavior at the molecular level And Chapters 11-14 illustrate the approaches of the modern day geneticist in his attempts to gain a detailed understanding of processes controlling gene expression While it is possible to delineate these three major sections each emphasizing a distinct experimental approach it must be realized that the yield of knowledge increases exponentially with the number of experimental approaches available to the investigator Information resulting from the application of each of these approaches must converge to give the same answers for any one biological phenomenon in any one experimental system Further if we can learn of details regarding a particular process by applying different experimental approaches our postulates concerning the underlying molecular mechanisms are likely to be more accurate But biological systems are not unrelated *Medical Journal of Australia*, 1914 Developmental Immunology Edwin Lowell Cooper, Eric Nisbet-Brown, 1993 This timely comprehensive volume draws on recent advances in molecular cellular and organismal biology to provide a detailed analysis of the phylogeny and ontogeny of the immune system This first book to provide broad coverage of this field gives a clear description of cellular and molecular interactions in the development of immune function Although most of this work is based on studies in vertebrates the intriguing observations of cytokine like molecules in invertebrates are discussed In a final section the contributors deal with abnormalities in the development and regulation of the immune system including primary immunodeficiency diseases and with the normal aging of the immune system Throughout the book an effort has been made to compare and integrate information from studies in diverse systems and to discuss the limitations of such comparisons This work will be of special interest to immunologists and theoretical cell and developmental biologists and much of the book will be useful to physicians working in pediatrics internal medicine and reproductive medicine
