Tumor Organoids Shay Soker, Aleksander Skardal, 2017-10-20 Cancer cell biology research in general and anti cancer drug development specifically still relies on standard cell culture techniques that place the cells in an unnatural environment As a consequence growing tumor cells in plastic dishes places a selective pressure that substantially alters their original molecular and phenotypic properties The emerging field of regenerative medicine has developed bioengineered tissue platforms that can better mimic the structure and cellular heterogeneity of in vivo tissue and are suitable for tumor bioengineering research Microengineering technologies have resulted in advanced methods for creating and culturing 3 D human tissue By encapsulating the respective cell type or combining several cell types to form tissues these model organs can be viable for longer periods of time and are cultured to develop functional properties similar to native tissues This approach recapitulates the dynamic role of cell cell cell ECM and mechanical interactions inside the tumor Further

incorporation of cells representative of the tumor stroma such as endothelial cells EC and tumor fibroblasts can mimic the in vivo tumor microenvironment Collectively bioengineered tumors create an important resource for the in vitro study of tumor growth in 3D including tumor biomechanics and the effects of anti cancer drugs on 3D tumor tissue These technologies have the potential to overcome current limitations to genetic and histological tumor classification and development of personalized therapies
