

EVOLUTION OF STARS

After 10 billion years, the small star will run out of hydrogen and starts fusing helium, which causes the star to expand to a red giant

www.pmfias.com

Planetary Nebula

After the star runs out of helium, the star will try to combine carbon, which the star can't combine. So the gas spreads apart from the star leaving behind a carbon dense white dwarf.

White Dwarf

When the white dwarf runs out of its remaining energy, it loses its brightness and becomes a brown dwarf.

After the star explodes, the star can do two different things based on its size

1. It can form a very dense NEUTRON STAR
2. It can form the most densest object in the universe, a BLACK HOLE

Neutron Star

When a massive star runs out of hydrogen, it expands and will make all kind of elements until it starts forming Iron

Accretion Processes In Star Formation:

Accretion Processes in Star Formation Lee Hartmann, 2009 A complete account of the underlying physical processes of accretion for graduate students and researchers Accretion Processes in Star Formation, 2017 **Principles of Star Formation** Peter Bodenheimer, 2011-07-10 Understanding star formation is one of the key fields in present day astrophysics This book treats a wide variety of the physical processes involved as well as the main observational discoveries with key points being discussed in detail The current star formation in our galaxy is emphasized because the most detailed observations are available for this case The book presents a comparison of the various scenarios for star formation discusses the basic physics underlying each one and follows in detail the history of a star from its initial state in the interstellar gas to its becoming a condensed object in equilibrium Both theoretical and observational evidence to support the validity of the general evolutionary path are presented and methods for comparing the two are emphasized The author is a recognized expert in calculations of the evolution of protostars the structure and evolution of disks and stellar evolution in general This book will be of value to graduate students in astronomy and astrophysics as well as to active researchers in the field

Evolutionary Processes in Interacting Binary Stars Y. Kondo, R.F. Sisteró, R.S. Polidan, 1992-06-30 This book contains the proceedings of IAU Symposium No 151 Evolutionary Processes in Interacting Binary Stars which was held from 5 to 9 August 1991 in Cordoba Argentina The primary aim of this conference was to review and evaluate our current understanding of the evolutionary processes in wide variety of interacting binary stars from their births to their deaths Subjects included the formation of binaries mass flow and transfer accretion processes and binaries with collapsed components such as novae X ray binaries and binary pulsars As the field covered is both broad and diverse there were in all thirty seven invited talks sixty two contributed papers were also presented In addition these proceedings contain comments from a panel discussion of the major unsolved problems of interacting binary stars *The Formation and Early Evolution of Stars* Norbert S. Schulz, 2012-05-24 Starburst regions in nearby and distant galaxies have a profound impact on our understanding of the early universe This new substantially updated and extended edition of Norbert Schulz's unique book *From Dust to Stars* describes complex physical processes involved in the creation and early evolution of stars It illustrates how these processes reveal themselves from radio wavelengths to high energy X rays and gamma rays with special reference towards high energy signatures Several sections devoted to key analysis techniques demonstrate how modern research in this field is pursued and new chapters are introduced on massive star formation proto planetary disks and observations of young exoplanets Recent advances and contemporary research on the theory of star formation are explained as are new observations specifically from the three great observatories of the Spitzer Space Telescope the Hubble Space Telescope and the Chandra X Ray Observatory which all now operate at the same time and make high resolution space based observing in its prime As indicated by the new title two new chapters have been included on proto planetary disks and young exoplanets Many more

colour images illustrate attractive old and new topics that have evolved in recent years The author gives updates in theory fragmentation dust and circumstellar disks and emphasizes and strengthens the targeting of graduate students and young researchers focusing more on computational approaches in this edition

Gas Accretion onto Galaxies Andrew Fox, Romeel Davé, 2017-03-23 This edited volume presents the current state of gas accretion studies from both observational and theoretical perspectives and charts our progress towards answering the fundamental yet elusive question of how galaxies get their gas Understanding how galaxies form and evolve has been a central focus in astronomy for over a century These studies have accelerated in the new millennium driven by two key advances the establishment of a firm

concordance cosmological model that provides the backbone on which galaxies form and grow and the recognition that galaxies grow not in isolation but within a cosmic ecosystem that includes the vast reservoir of gas filling intergalactic space This latter aspect in which galaxies continually exchange matter with the intergalactic medium via inflows and outflows has been dubbed the baryon cycle The topic of this book is directly related to the baryon cycle in particular its least well constrained aspect namely gas accretion Accretion is a rare area of astrophysics in which the basic theoretical predictions are established but the observations have been as yet unable to verify the expectations Accretion has long been seen around the Milky Way in so called High Velocity Clouds but detecting accretion even around nearby galaxies has proved challenging its multi phase nature requires sensitive observations across the electromagnetic spectrum for full characterization A promising approach involves looking for kinematic signatures but accretion signatures are often confused with internal motions within galaxies Accretion studies therefore touch a wide range of astrophysical processes and hence a wide cross section of the astronomical community As observational facilities are finally able to access the wavelength ranges and depths at which accretion processes may be manifest the time is right to survey these multiple lines of investigation and determine the state of the field in accretion studies of the baryon cycle
