Abstract The authors examined the effects of a 12-week, 1000 kcal deficit diet on the body composition and metabolic profile of 10 obese women. The diet was composed of 25% protein, 40% carbohydrate, and 35% fat. The subjects lost an average of 10.5 kg (23.1%) of body weight, 6.5 kg (14.5%) of fat mass, and 4.0 kg (8.9%) of lean mass. The diet was well tolerated, and the subjects maintained a high level of physical activity throughout the study. The authors conclude that a 1000 kcal deficit diet is an effective means of achieving weight loss in obese women.

Abstract and background: There are a number of reasons why the use of a single, one-dimensional measure of quality of life is inadequate. This paper discusses the importance of using a multi-dimensional measure of quality of life, and the importance of using a measure that is valid, reliable, and sensitive to change.
