

moments could be e.g. to increase the "internal lever arm" of the arch, for example by creating a trussed arch, such as that of Figure 21, or by closing an arch structure, where each half consists of a lenticular truss, see Figure 21 (b).

Fig. 21: Arch structures subjected to triangular load distribution. (a) Common arch structure; (b) Arch structure consisting of two lenticular trusses connected at the ridge. The effect of relatively large local bending moments M (and N) can significantly be reduced by closing a structure with larger internal lever arm (case b).

The three-hinged arch is the most common type of glulam arches. Therefore, only indications concerning the design of such types of arches will be given in the next sections.

Conceptual design

Generally, architectural considerations determine the shape and possibly the rise of the arch. However, for economic reasons and also in order to limit the horizontal thrust, some "rules of thumb" concerning depth-to-span ratios, maximum span etc. should be followed. Figure 22 gives indications for preliminary design of three typical arch profiles.

Two-hinge arch

(a)

Three-hinge arch

$l=30-100\text{ m} ; f=0,50-0,70 ; H=1,0-1,5$

(b)

Trussed arch (two- or three-hinge)

$l=30-100\text{ m} ; f=0,40-0,70 ; H=1,0-1,5$

(c)

Fig. 22: Preliminary design guidance for three different arch types.

Design of three-hinged arches

The three-hinged arch is stable against horizontal forces in its own plane and statically determinate, which means that the moment distribution is not affected by uneven settlement of the foundations or by unforeseen deformations in joints and connections. Further, the three-hinged arch has hinges at the springing points, which simplifies the construction of the foundations. In poor soil conditions, the horizontal reactions at the supports can be taken by tension members between the foundations (located within or under the slab).

Stability control

Arches are as a rule slender structures and the design must therefore – even to a larger extent than for frames – be carried out by taking the risk of buckling into account, i.e. both in-plane and out-of-plane buckling.
