

Battery

A Battery provides electricity.

Batteries allow us to use portable devices such as mobile phones, vacuum cleaners and torches.

Switch

A Switch controls electricity.

Shown above is a Toggle Switch. Other common switches include a Push, Button and Slide Switch.

Light Bulb

A Light bulb provides light.

Discontinued light bulbs have lit up our homes and streets for many years but are being phased out and are less common today.

Buzzer

A Buzzer produces sound.

Buzzers have a red wire which represents the positive terminal (+) and a black wire which represents the negative terminal (-).

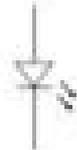

Motor

A Motor produces movement.

Motors provide rotary motion. The direction of rotation can be reversed by swapping over the positive and negative connections.

Light Emitting Diode

A Light Emitting diode produces light.

LED's are used in display panels as they replaced incandescent light bulbs because they consume less electric energy making them eco-friendly.

Resistor (fixed)

A Resistor resists electricity.

Resistors are used to restrict the flow of electric current. The resistor shown above has a fixed value. The coloured bands are used to indicate the level of resistance. Their resistance is measured in Ohms (Ω).

Variable Resistor

A Variable Resistor changes resistance when manually adjusted.

Variable Resistors resist electric current in the same way as a standard fixed resistor, however their resistance can be increased or decreased when the slider is rotated by hand.

Light Dependent Resistor

A Light Dependent Resistor changes resistance as the light level changes.

LDR's have a low resistance in daylight and a high resistance in the dark. In simple terms, the LDR is a variable resistor controlled by the level of light. It can therefore be used as a light sensor in a circuit.

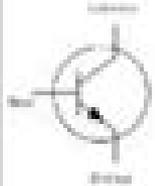

Thermistor

A Thermistor changes resistance as the temperature changes.

Thermistors are often used in heat detection devices to monitor temperature change in air or liquids. An increase in temperature causes a decrease in resistance.

Transistor

A transistor is a high speed electronic switch.

Transistors are controlled by the base leg. When a voltage of some more 0.6 volts is applied across the base leg, this allows a larger current to flow between the collector and emitter legs.

Diode

A diode is a one-way conductor.

Diodes conduct electricity in one direction but insulate electric current in the other direction. They are often used to protect transistors from harmful electromagnetic force (back e.m.f.) generated in circuits containing a motor.
