Combinatory Analysis Percy Alexander Macmahon, 2013-09 This historic book may have numerous typos and missing text Purchasers can usually download a free scanned copy of the original book without typos from the publisher Not indexed Not illustrated 1915 edition Excerpt that p r has no longer the number of different letters exceeding 2 any simple value for different classes of permutations It is not possible to obtain expressions for l and %xp r in the foregoing manner 110 The Parity of the Greater Index The permutations of a 7 are such that the number with an even index is equal to the number with an uneven index whenever more than one of the numbers k are uneven Consider the function $l_2 i j k l_2 i l_2 j l_2 k$ if we put therein x 1 and the function happens to vanish it must be because the permutations with even index are equal in number to those with uneven index This is the case because the function is equal to %Gpxp where there are Cp permutations having the index equal to p Under what conditions does x 1 cause the function to vanish The factor m becomes 2 for x 1 whenever m is uneven Eliminating these factors we are left with a function which may be of the form when x 1 and can be evaluated This

happens when numerator and denominator contain the same number of factors to wherein T_0 is even. If this be not the case the numerator must contain more of such factors than the denominator and the function must vanish for $x = 1$. Observe that the numerator cannot involve fewer of such factors than the denominator for in that case the function would become infinite for $x = 1$ which from the nature of the function is absurd. We have then to find out the circumstances under which the numerator of the complete function involves more factors than the denominator T_0 being even. If we consider the product $1, 2, \dots, n$ and denote by E_n the greatest integer in $n/2$ it will be seen that the number of factors to

George Andrews is one of the most influential figures in number theory and combinatorics. In the theory of partitions and q -hypergeometric series and in the study of Ramanujan's work he is the unquestioned leader. To suitably honor him during his 70th birthday year an International Conference on Combinatory Analysis was held at The Pennsylvania State University during December 5-7, 2008. Three issues of the Ramanujan Journal comprising Volume 23 were published in 2010 as the refereed proceedings of that conference. The Ramanujan Journal was proud to bring out that volume honoring one of its Founding Editors. In view of the great interest that the mathematical community has in the influential work of Andrews it was decided to republish Volume 23 of The Ramanujan Journal in this book form so that the refereed proceedings are more readily available for those who do not subscribe to the journal but wish to possess this volume. As a fitting tribute to George Andrews many speakers from the conference contributed research papers to this volume which deals with a broad range of areas that signify the research interests of George Andrews. In reproducing Volume 23 of The Ramanujan Journal in this book form we have included two papers one by Hei Chi Chan and Shaun Cooper and another by Ole Warnaar which were intended for Volume 23 of The Ramanujan Journal but appeared in other issues. The enormous productivity of George Andrews remains unabated in spite of the passage of time. His immensely fertile mind continues to pour forth seminal ideas year after year. He has two research papers in this volume. May his eternal youthfulness and his magnificent research output continue to inspire and influence researchers in the years ahead.
