

TRANSLATING ADDRESSES

LOCAL ADDRESS TABLE (LAT) – Contains routing information. Defines internal IP address ranges on the local client requesting an object from an Internet server via either the object directly from the Internet server and bypasses the proxy server. Excluding external addresses causes external client requests to Internet servers to be blocked. If external addresses are included in the LAT, access to Internet resources will be granted to external addresses. Internal requests for these addresses would also bypass the proxy server. Once the LAT is created, it is stored in a file called `MSDTC.LAT.TXT` in the default location `C:\MSDTC\LAT.TXT`. Proxy servers downloaded from the Internet also download a copy to keep their client configuration current.

CHOOSING SERVICES

Service types are configured through property sheets. These sheets are necessary. Creating, editing, and deleting dial-up can be found in the tabs of the property sheet. There are three services: **HTTP PROXY SERVICE**

- Compatible with CERN-proxy protocol
- SETP and FTP caching
- Service proxying and service forwarding in conjunction with NAT publishing
- User-level-defined permissions for protocols
- Restricted access to the Internet
- IP address aggregation
- Logged information

SECURITY PROXY SERVICE

- Uses either TCP/IP or FTP/SFTP on the Internet network
- Windows NT Challenge/Response authentication
- Compatible with most Windows Sockets 1.1-compatible programs
- Restricted external and internal access
- Restricted access to the Internet
- IP address aggregation
- Logged information
- Client compatibility

SECURITY SERVICE

- Secure communication between client and server
- Uses the TCP/IP protocol on the Internet network
- Supports the Microsoft Protocol
- Compatible with popular operating systems
- Log information about proxy requests

CONNECTIVITY METHODS

A connectivity method is the protocol the remote server uses to communicate across the network. They are: **HTTP PROXY** – Used primarily in client service networks.

- Advantages** – Speed, dynamic addressing, existing hardware network, security
- Disadvantages** – Protocol connection; only supports Windows NT, Windows 95, and NT; TCP/IP – Widely used by almost all platforms
- Advantages** – Caching, no protocol connection, supports all clients, availability, will work for the default method.
- Disadvantages** – Address authentication, security.

FAULT TOLERANCE STRATEGY

FAULT TOLERANCE – The ability to provide uninterrupted access to the Internet or network if the proxy server goes down. Used for remote site connections or networks with more than one connection to the Internet. **LOGICAL ARRAY** – A group of proxy servers acting as a single logical cluster that result in multiple proxy servers cooperating with each other to avoid interrupted service. Each server is provided when each proxy server in an array keeps a list of servers that are available or down. A request outgoing server can be forwarded to a proxy server if that server is listed as a backup server. Calculations take place at the proxy server level on at the Internet level. The Internet would be Internet Explorer. **ROUND ROBIN** – A proxy server function providing load balancing to requests going across portions of your network at the Internet. There is really one connection to the Internet network to a single array. Configuring routing provides a backup network path to the Internet and/or the virtual office of a branch. Supported only by default Proxy server. Routing can be configured to route client requests to a proxy server regardless of activity in the Internet. A connection between web for a connection with an IPDN line or a modem line.

Handling Requests from Cache

TYPES OF AUTHENTICATION

There are three types of authentication available with Internet Information Server (IIS). Configure the authentication method that you will use in the WWW service properties page in Internet Service Manager. **Authentication is set through the Service tab in the WWW service properties sheet.** **ALLOW ANONYMOUS LOGIN** – A default user account is created named `IUSR计算机名` at the time of IIS installation. In the Internet Authentication section of the WWW service properties page, check `Allow Anonymous`. Services can be accessed by anonymous users for which the `IUSR计算机名` computer account has permissions. No Access rights are assigned with IIS's permissions for the `IUSR计算机名` account to the restricted directory or file.

BASIC AUTHENTICATION (CLEAR TEXT) – Uses access the user to clear text with user credentials provided. It offers weak security and should only be used when necessary. A necessary example is a Web-based Web browser. Basic authentication can be applied to all users or a subset of users. **SECURITY PROXY SERVICE AUTHENTICATION** – Does not require user credentials across the network. It performs calculations on the server and the client. There is no prompt for a user or password because the client software was established login information. It is more secure than basic but only works if the client browser is Microsoft Internet Explorer; the client and server can be in the same or a trusted domain and it must be on a Windows platform.

LOAD BALANCING

LOAD BALANCING – Process of distributing the workload equally among multiple servers. There are three methods:

Distributed Name System (DNS) – Individual IP addresses for each proxy server are mapped to the same domain name. More through a list of IP addresses mapped to the domain name in the DNS server creates routing requests. Not best solution.

Array – Each proxy server maintains a list of servers that are currently up or down. Provides for balancing in the array. Load balancing is achieved by redistribution of all array members. You will need to create a domain name in DNS. Multiple domain name to the IP addresses of proxy servers in the array. The loss of an individual proxy server will cause the array to reconfigure.

Cache Array Mirroring Protocol (CAMR) – Used in arrays to achieve load balancing and fault tolerance with caching. Achieved using multiple proxy servers arranged as a single logical cluster. Calculations based on the proxy array member locations and the Uniform Resource Locator (URL) determine the request resolution path. A proxy called `anytime` distributed working will occur. The cache object is entered by the proxy server's browser that has the object in cache or the array member. The correct proxy server is accessed by the browser. Reduces network traffic and increases speed needed for caching.

MINIMUM HARDWARE REQUIREMENTS

- At least 660,000 or better, or Alpha 600
- At least 10MB of disk space for installation of Proxy Server. There must be 20MB + 2.0MB per user for caching. There must also be an NTFS partition of at least 1MB.
- At least 20MB of RAM. 20MB for 32-bit-based systems.

You may want to disable an single for optimum configuration, especially RAM.

CONFIGURATION TOOLS

Microsoft Internet Service Manager is your primary tool for configuring and administering Proxy Server. There are several other tools that you can use.

REQUEST REDIRECTOR – Available by default on Windows NT Server. They can be used to redirect or request registry files. They can also be used to create, edit, add, delete, rename, and create new files and folders.

PROXYMAP – A command-line utility used to perform administrative and configuration tasks. Can be used to batch script used to control multiple servers, to a control proxy, or to the client software Proxy Server is installed and type meaning. It is a display-oriented system.

WINDPROX – Used to add, delete, or edit Windows Proxy server general definitions. At a command prompt, which is the proxy server directory. Type `WinProx for syntax`.

NET START – Command used to start and stop WWW services. With Proxy server, and Socks Proxy server.

SERVICES CONTROL PANEL – Used to enable or disable services. Controls whether a service starts manually or automatically.
