

A Lens on the Universe

Measuring the amount of matter in the universe — including the invisible dark variety thought to account for ~85% of matter — is fundamental to understanding the evolution of the universe. Using a phenomenon called 'gravitational lensing' scientific collaborators have produced the most precise matter map to date. The results were obtained using the Atacama Cosmology Telescope (ACT) in Chile.

Gravitational lensing occurs when light travels near a massive object — such as a galaxy, galaxy cluster, or clump of dark matter. The gravitational field generated by these huge objects bends the light's path.

Mapping Matter with Light

Cosmic microwave background (CMB) radiation — ancient light emitted when the universe was in its infancy — has travelled billions of years, witnessing the formation of stars, galaxies, and galaxy clusters. The gravitational fields of these massive objects have influenced the path of CMB light.

Light captured by ACT was used to produce a **CMB lensing mass map**, a visualization of all the matter in the path of the CMB light. Map data was extracted to find the overall lumpiness and expansion rate of the universe; Cosmic structures were seen to have evolved just as expected under Einstein's law of gravity.
