Dynamics and Kinetics in Structural Biology Understand the latest experimental tools in structural biology with this pioneering work Structural biology seeks to understand the chemical mechanisms and functions of biological molecules such as proteins based on their atomic structures Until recently these structures have been studied only statically using procedures which deliberately freeze atomic motion However freezing eliminates the rapid structural motions so essential to biological activity and function the molecules are inactive But with the recent development of X ray free electron laser XFEL sources efforts to conduct dynamic experiments have expanded using the principles of dynamics and kinetics to capture active biological molecules as they function Dynamics and Kinetics in Structural Biology promotes the development of these experiments and their successful application It grounds readers in the foundational principles of dynamics and kinetics proceeds through extended discussions of experimental procedures and data analysis techniques and explores experimental frontiers in structural dynamics The book will aid researchers to gather and interpret cutting edge data on the dynamic structure of biological molecules under conditions where they retain their biological functions Dynamics and Kinetics in Structural Biology offers readers Authorship by founding figures in the field In depth presentation of time resolved X ray crystallography solution scattering and more A pioneering contribution to a rapidly developing field of study Dynamics and Kinetics in Structural Biology is essential reading for graduate students scientists researchers and industry professionals engaged in structural studies of biological systems Industry professionals considering dynamic studies in the development of new product lines will also benefit

Atomic Scale Dynamics at Surfaces Giorgio Benedek, Jan Peter Toennies, 2018-12-28 Experimental advances in helium atom scattering spectroscopy over the last forty years have allowed the measurement of surface phonon dispersion curves of more than 200 different crystal surfaces and overlayers of insulators semiconductors and metals The first part of the book presents at a tutorial level the fundamental concepts and methods in surface lattice dynamics and the theory of atom surface interaction and inelastic scattering in their various approximations up to the recent electron phonon theory of helium atom scattering from conducting surfaces The second part of the book after introducing the experimentalist to He atom spectrometers and the rich phenomenology of helium atom scattering from corrugated surfaces illustrates the most significant experimental results on the surface phonon dispersion curves of various classes of insulators semiconductors metals layered crystals topological insulators complex surfaces adsorbates ultra thin films and clusters The great potential of helium atom scattering for the study of atomic scale diffusion THz surface collective excitations including acoustic surface plasmons and the future prospects of helium atom scattering are

presented in the concluding chapters The book will be valuable reading for all researchers and graduate students interested in dynamical processes at surfaces **International Tables for Crystallography, Volume B** Uri Shmueli, 2008-08-27 International Tables for Crystallography are no longer available for purchase from Springer For further information please contact Wiley Inc follow the link on the right hand side of this page Volume B presents accounts of the numerous aspects of reciprocal space in crystallographic research After an introductory chapter Part 1 presents the reader with an account of structure factor formalisms an extensive treatment of the theory algorithms and crystallographic applications of Fourier methods and fundamental as well as advanced treatments of symmetry in reciprocal space In Part 2 these general accounts are followed by detailed expositions of crystallographic statistics the theory of direct methods Patterson techniques isomorphous replacement and anomalous scattering and treatments of the role of electron microscopy and diffraction in crystal structure determination including applications of direct methods to electron crystallography Part 3 deals with applications of reciprocal space to molecular geometry and best plane calculations and contains a treatment of the principles of molecular graphics and modelling and their applications A convergence acceleration method of importance in the computation of approximate lattice sums is presented and the part concludes with a discussion of the Ewald method Part 4 contains treatments of various diffuse scattering phenomena arising from crystal dynamics disorder and low dimensionality liquid crystals and an exposition of the underlying theories and or experimental evidence Polymer crystallography and reciprocal space images of aperiodic crystals are also treated Part 5 of the volume contains introductory treatments of the theory of the interaction of radiation with matter dynamical theory as applied to X ray electron and neutron diffraction techniques The simplified trigonometric expressions for the structure factors in the 230 three dimensional space groups which appeared in Volume I of International Tables for X ray Crystallography are now given in Appendix 1 4 3 to Chapter 1 4 of this volume Volume B is a vital addition to the library of scientists engaged in crystal structure determination crystallographic computing crystal physics and other fields of crystallographic research Graduate students specializing in crystallography will find much material suitable for self study and a rich source of references to the relevant literature

Ordering in Macromolecular Systems Akio Teramoto, Masamichi Kobayashi, Takashi Norisuye, 2012-12-06

This volume summarizes the papers presented at the First Osaka University Macromolecular Symposium OUMS 93 on Ordering in Macromolecular Systems which was held at Senri Life Science Center Osaka Japan on June 3 through June 6 1993 The symposium covered the three topics

- 1 Crystallization and Phase Transitions
- 2 Polymer Liquid Crystals and
- 3 Block Copolymers Polymer Blends and Surfaces and invited leading scientists in these fields

At present any of these topics is a hot issue in itself and frequently taken up separately in many occasions It is noted however that all these topics are correlated with each other with the keyword Ordering and their combination provides a unique feature of the present symposium in reflecting the interactions among investigators working in these important fields with the common ground expressed by the keyword Ordering

Nineteen invited lectures and 40 posters of both experiment and theory were presented at the symposium and the eighteen lectures and ten poster presentations contribute to this volume

In the first topic crystal structures and their transitions were discussed from kinetic as well as static points of view attention was paid to give a molecular level interpretation of the structure phase transition and physical properties using theories and simulations The second topic was mainly concerned with static structures and thermodynamic properties of polymer liquid crystals including phase behaviours
