

Chapter 5 – Elasticity and Its Applications

Do they depend both on the numbers of firms producing?

- What is elasticity? What kinds of factors can increase, decrease, or stabilize it?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

Do they?

Do they depend both on the numbers of firms producing?

Do they depend on the price elasticity of demand and supply and on whether you have

monopoly or are facing competition? Do they depend on the opportunity cost of your time, on your willingness to spend your time on this?

Do they depend on the numbers of firms producing and on other variables? Do they depend on your time spent on this? Do they depend on other variables? Do they depend on your personal life, on other variables?

Do they?

- Some price elasticity measures how much the quantity demanded of a good or service changes in response to a change in price.
 - One type of elasticity measures how much demand for one variable will fall if another variable
- Definition:
 - Elasticity is a numerical measure of the responsiveness of Q^D or Q^S to a change in its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P .
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Using a demand curve, P and Q must always be opposite directions, which would make price elasticity negative. We will take the absolute value and report relative changes as positive numbers.

Example:

The price elasticity of demand for apples is 0.5. If the price of apples falls by 10%,

Calculating Percentage Change

Example: P falls 10% from \$10 to \$9, elasticity = 0.5 (absolute)

Result: Q

falls 5% from 100 to 95, elasticity = 0.5 (absolute)
