

## Chapter 5 – Elasticity and Its Applications

Do they depend both on the numbers of firms and on the price?

- What is elasticity? What kinds of factors can increase, decrease, or stabilize it?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

Do they?

How does elasticity fit into consumer choice theory?

How does elasticity measure and maximize net consumer surplus?

How does elasticity help in understanding the opportunity cost of your time, as well as the benefits of saving your time to study?

How does elasticity help explain why you want to sell an item yesterday if you have your price, but don't have your customer? How should you set your demand for an input to maximize profit?

What are?

- Total price elasticity measures how much the variable responds to changes in another variable.
  - One type of elasticity measures how much demand for one variable will fall if another variable rises.
- Definition:
  - Elasticity is a numerical measure of the responsiveness of  $Q^D$  or  $Q^S$  to a change in its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much  $Q^D$  responds to a change in  $P$ .
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a demand curve,  $P$  and  $Q$  move in opposite directions, which usually makes price elasticity negative. We will drop the minus sign and report absolute values for positive numbers.

Example:

The price elasticity of demand for apples is 0.50. If the price of apples falls by 10%:

Calculating Percentage Change

Price falls from \$1.00 to \$0.90, a change of (10/100) = 10%

Quantity sold:

2000 units at \$1.00, or 1800 units at \$0.90, a change of (200/2000) = 10%
